

Easy to install, effective protection against burglars

Scheffinger presents the "EM3", a bolt that provides compact, highly efficient protection against forced opening of windows and doors, and is also easy to install.

Statistically, a burglary takes place every two minutes in the Federal Republic of Germany. The perpetrators usually take advantage of the unsafe condition of windows and doors to gain access to the property. House and apartment owners often find themselves powerless and at the mercy of burglars. Apart from the loss of personal property, the fact that a stranger has entered your own four walls is usually an additional psychological burden for the burglary victims. It can take quite some time to overcome the fear of becoming a victim of a burglary again.

Effective protection from burglars

The product can be retrofitted to any window or patio door as intrusion protection in a few easy steps. The decisive criteria when the product was invented were to create a mechanical lock that applies a considerable amount of closing force, but was also extremely easy to install and operate. Furthermore, during development it was also extremely important to scheffinger to have a simple, timeless and beautifully designed product.

Easy installation and uncomplicated use

A prerequisite for the development of the innovative "EM3" was to provide easy to use protection with maximum efficiency that could be operated by anyone.

A security system that does not require specialized personnel!

The sleeve is installed next to the window and/or the patio door frame, and the latch is simply inserted into the sleeve to secure. In order to open the window, the latch is simply pulled out of the sleeve and reinserted in a different position. The principle of the locking sleeve is retained by this change.

Extremely high bolt resistance

As well as the ease of handling, the main focus of the product is on its outstanding material strength. In order to provide a high degree of stability, all components are made from one piece so that the bolt can withstand extremely high pressure. Elements made from 100% steel (latches and sleeve) provide reliable door and window protection.

1 BOLT – MANY POSSIBILITIES

The sleeve can be mounted in different directions, therefore covering all applications.

Mounting positions

Frame | Masonry/soffit | Window sill/floor

This multi-application is special because it does not require several different security solutions.

Positive eye-catcher

Scheffinger has also put a considerable amount of emphasis on design in the home. Clean lines and high quality material transform the bolt into a simple, timeless and beautifully designed object whose appearance is exceptional and unique. Unlike conventional products, the "EM3" lock is made from one piece, and therefore has no welds. The novel and cost-effective intrusion protection for tenants and owners of apartments and houses in the private sector and for architects and construction companies is particularly interesting. Company scheffinger with headquarters in Frankfurt am Main has designed the "EM3" bolt to provide reliable and cost-effective protection for windows and doors so that they cannot be levered off by burglars.
